Information – Innovative Approach to Library Activity and Modern Perspective

Xudaybergenova Marjan Baltabaevna
Lecturer in the chair the Culture and Library activities Nukus branch of the Uzbek State Institute of Arts and Culture

ABSTRACT

This article talks about further improvement and application of innovative methods in the field with a modern approach to information library activity. The processes of applying innovative innovations in the field of information library in New Uzbekistan and their importance in the development of the field were also discussed.

The work is organized according to the type of institutions providing library and information services to the population, and in order to carry out activities concisely, correctly, plannedly and in a certain order, to improve the quality and efficiency of work, departments, work categories , in terms of content and tasks, they are organized according to their compatibility with each other and the type of work. The structural divisions of each information-library center change and improve based on the requirements of the time, specific features of the library's activity, the tasks before it and many other internal and external influencing factors. Reform of the information-library sector plays an important role in the development of the country in the implementation of the transformation processes of the state policy in the cultural-educational sector and youth. Because reading books gives wings to people's psyche and mood, and mature and unique works not only have a positive effect on the prosperity of society, but also on the success of future tasks.

We understand well that at the current stage of the development of new Uzbekistan, the reforms implemented in the spiritual and educational spheres, along with social, economic and political factors, are of great importance.

We all understand well that if the body of society is economy, then its soul and spirit is spirituality. We rely on these two strong pillars to build a new Uzbekistan, that is, a strong economy based on market principles and a strong spirituality based on the rich heritage of our ancestors, national and universal values. This requires high experience and skills from the representatives of the information-library sector.

Only pedagogues of the field can bring these feelings to the minds of librarians. That is, the criterion of educating students and young people with strong spirituality is implemented by the teachers and

pedagogues of the information-library activity. For example, the demand of the Third Renaissance in New Uzbekistan is to educate independent-thinking, high-potential young people who can compete with the world's youth in terms of knowledge and thinking. thinking and taste, knowledge of foreign languages, all-round maturity is an urgent task of today. Of course, when talking about the role of information-library pedagogy in the spiritual education of young people, the pedagogical tasks performed by information-library pedagogy in these processes are extremely incomparable. Information-library pedagogy performs an extremely important task of forming a culture of reading through the secrets of history and experiences in improving the spiritual education of young people. In regard to the role of information-library pedagogy in improving the moral education of young people, it is worth highlighting the important points made by Doctor of Sociology Abdusalam Umarov in his work "Reading culture: personality, society, development".

"The role of independent education and reading in a person's pursuit of perfection is incomparable, and it is clear that a person can develop and perfect himself with the help of reading under any conditions and at any stage of the development of society.

According to the words of existentialists, only a person whose main purpose of life is self-formation and development can claim perfection. This makes the reading factor an urgent social necessity. It is not for nothing that reading culture is treated as a priority issue in every society that strives for a great perspective". When it comes to who educates individuals with perfect moral education in the society that implements information-library pedagogy, first of all, we pedagogues come to the field with high responsibility. We are proud of the high level of attention paid to pedagogues like us in New Uzbekistan.

Of course, in the effective organization of classes in educational institutions, as we noted above, along with mature personnel, the role of normative documents on education and teaching-methodical support is extremely important. Urgent tasks such as creating and putting into practice modern teaching methodology, strengthening students' desire to consciously choose a profession, and a completely new approach to the creation of textbooks are being set by our President with this goal in mind. Such work is one of the important tasks of organizational work and information-library pedagogy. In fact, the acceleration of the globalization process requires a radical revision of our educational programs, the creation of improved normative documents and educational-methodical complexes that serve to bring up young people who have broad knowledge and can think logically. The reading culture determines the spiritual image of the people. Therefore, today in our country, great attention is being paid to improving the reading culture of the population, especially the young generation.

Another aspect of information-library pedagogy is that the teacher must constantly develop his knowledge and skills together with the students. After all, they are educators of mentally mature and well-rounded young people. Information-library pedagogy is not limited to skills. It is a pedagogical activity that studies the criteria of systematic development. Updates and changes in the field of science and education occupy a special place in the framework of comprehensive reforms implemented in our country.

It would be no mistake to say that science, intelligence, high spirituality and enlightenment are the main principles that determine the country's economic power and future. After all, the enthusiasm of scientists ensures the development of science, and science ensures the development of society. The fact that Science, scientific and technical development is rapidly developing and changing in our country, and that mutual competition is intensifying on a global scale, has shown that it is an objective necessity to improve the system of training highly qualified scientific and scientific-pedagogical personnel.

Taking into account that information-library pedagogy has served as an ancient cradle of intellectually mature youth education, this activity is developing with new forms and methods, interactive methods. Due to the rapid use of modern information technologies in library and

information institutions today, it is natural for the technologies of library and information institutions to change, improve and adapt to the times. Technology is not forever, it can change. Whether it is a separate account of new books or a way to record and organize books that are sent home, it must serve those who come to get literature and information. Therefore, when choosing technological options, a number of main criteria are followed:

➢ efficiency of book or information processing or satisfaction of consumer demand;

➢ ensuring reliability or more accurate performance of the given task;

➢ optimal efficiency;

➢ cost recovery (that is, the cost spent on this or that process should not exceed the value of the benefit obtained from its use).

It will not be appropriate to complicate the library technology and some of its processes if it is not necessary. The diversity of the work of library-information institutions occurs in two ways. The first group of the leading tasks that require the most and the most effort is the main task of the library-information institution-providing services to consumers and meeting their requirements.

The main tasks of the information library are as follows:

✓ ensuring users' use of information-library resources;

✓ creation of conditions to satisfy the intellectual, spiritual-ethical, cultural and educational needs of users;

✓ to support the restoration and further development of national culture, preservation of cultural heritage objects;

In our republic, information and library institutions are forming new criteria for obtaining information using modern high-performance information and communication technologies. Efforts are being made to create favorable conditions and a wide base of information resources to meet the intellectual, educational, spiritual, moral and cultural needs of the population, especially young people. The level of service in information-library institutions is constantly improving, and new projects are being put into practice. Currently, information-library institutions are using various forms of work in order to expand the range of their activities. Great attention is paid to creative approaches that can combine traditional and virtual practice. The more a person learns about the activities of libraries on the Internet, the more interesting and relevant it is, the more likely the reader is to become a user of that library or a member of blogs and social media. A prerequisite for this is that the library website, blogs and pages in social networks, articles reflecting the results of research, links to other resources, contests, quizzes, video and photo materials are filled with interesting content.

All this is a powerful tool for attracting users to the library, raising its image, and promoting reading. One of the tasks facing information-library institutions is that people do not just "walk" on the Internet, but get useful, interesting, reliable information from librarianship-related sites, blogs, pages on the network, and communicate with librarians and regular users. They should come in and exchange opinions, discuss the various issues covered in it, and leave their comments.

The more the information-library institution advertises its activity on the network, that is, the process of real communication with the user, the higher the motivation to use the resources of the library on the network. And if the user sees more interesting information about libraries' funds, contests, presentations and other various events, then the desire to visit the library will increase.

President Sh.M. Mirziyoyev: Every state, every people in the world is powerful primarily because of its intellectual potential and high spirituality. He emphasized that the source of such inexhaustible power is, first of all, the great discovery of human thought – books and libraries. In fact, a country with a strong spiritual potential will have unlimited spiritual strength. Today, in Uzbekistan, as well

as in the world community, the library system is in the process of integration. Because the era is becoming so globalized, hundreds of books can fit in a small phone in each of our hands. It is not for nothing that the population, especially young people, have a high demand for an electronic library. creation of virtual and e-libraries is a very expensive and labor-intensive process. The experience and calculations of developed countries show that when information and library institutions organize their electronic resources individually, they lose huge resources, in most cases, due to low levels of staff, they are organized on the basis of errors such as duplication of records. It is natural to spend a lot of money to bring innovative methods to the industry. But the quality of the work done should be of high quality first. This requires significant investment in innovative methods and training of specialist personnel. From this point of view, new tasks were assigned to libraries.

Efficiency of work is clearly visible in the process of digitization of resources in the library. First of all, the application of innovative techniques and methods in the process of integration in modern library-information activities gives great results. The number of electronic resources is increasing day by day. It is no exaggeration to say that the indicator of creating convenient opportunities for users in libraries has risen to a new level in terms of quality.

Interlibrary subscription (LC), which emerged as a natural condition of the system of electronic delivery of electronic resources and documents, is typical for the entire Internet system and is the transfer of books, articles, electronic materials and the delivery of documents to users collectively or individually. Mail, fax, e-mail, scan-to-order, electronic delivery are delivery mechanisms. The means of creating electronic resources or the transfer of printed publications to an electronic resource is the change and expansion of the publishing function of libraries, the creation of a local electronic resource on the main topics of the library's print fund, in addition to the publication of catalogs, bibliographic indexes, reviews, methodological recommendations, articles. In the course of these works, the need to apply innovative methods to the information-library system arose. Some innovative methods are used in library activities and serve to meet the needs of users.

But, "To what extent should the system be taught to students of higher education?" it is appropriate to raise the question. If a graduate student starts working in a library tomorrow, will he be able to use these innovative methods? To what extent the student acquired skills and used technical tools in the course of the internship. For this purpose, all opportunities should be created in the information resource center of HEI. In the implementation of innovative methods, it is necessary not only to use them, but to get students to know and learn these innovative techniques, to go abroad to gain experience, and to enter the activities of higher education institutions that provide personnel for information and library services. We can say that this issue is one of the aspects of information-library activities that make teachers think, and if necessary, cause some concern. In the second chapter of the Concept "Development of the information-library sector in the Republic of Uzbekistan in 2019-2024", insufficient attention is paid to the issues of integration of information-library institutions into the world library community, working with users and residents, including the implementation of innovative methods of developing reading culture, as well as mobile It is noted that in the conditions of the active development of communication, numerous gadgets and Wi-Fi, the increasing flow of e-books and book readers. Librarians are the persons who run the system independently. The popularity of special programs along with e-books requires the representatives of the field to learn and apply new innovative methods. In New Uzbekistan, information-library activities are undergoing a new creative approach and an innovative development period. In the decision of the President of the Republic of Uzbekistan dated June 7, 2019 "On further improvement of information and library services to the residents of the Republic of Uzbekistan", taking into account the development of information and library activities, information and communication technologies and modern global trends the task of reform is set. Today, it is necessary to pay great attention to the development of communication technologies and modern professional personnel in information resource centers and to be responsible in rising to the stage of high integration.

Today, the library is an information service of social life quick adaptation to rapidly changing

conditions, its requires improvement of tools, forms and methods. That's it expand access to relevant information for users' mental development and self-improvement about the humanization of education in the practice of support and teaching experience and achievements in our country and foreign countries a generalization-based approach is needed. Librarians serve users in an in-depth manner the level of competence, innovation and creation of innovations, entrepreneurship, attention to factors such as the ability to use innovative technologies should give. The future of humanity depends on the development of science and its production The future of mankind depends on the development of science and its production determined by execution. Therefore, users especially encouraging young people to learn the basics of science necessary. Application of innovative technologies in all areas of production, to create their new ones, to create large and small systems in our country it is necessary to regularly promote that it is the duty of every person.

Application of new technologies, information-library institutions implementation of information dissemination functions and information acquisition the scope of automation and computerization and depends on the speed. Reform of the information-library sector information-library institutions the weakness of the regulatory and legal framework, concentration of information-library funds and lack of technical equipment, information-library staff level of training and retraining and their social support occurred due to low.

Currently, the professional information-library community of Uzbekistan democratic socio-cultural institution to information-library institutions, today development of culture of information society and socio-economic of the country is considered as an information base of development, as well as an information library as an indicator of the level of society's culture counts. On studying the state of information-library activity in the republic information-library, taking into account modern requirements development of institutions, information and library services of the population regulatory and legal in order to ensure social guarantees of its use showed the need to improve the base.

Technical re-equipment of information-library institutions, new introduction of information technologies to information-library institutions is high requires attracting qualified specialists, their value in the labor market and it is much higher than today's capabilities of information-library institutions.

The major reforms initiated in the information-library activity system serve to eliminate existing deficiencies in the field. When we talk about books and book reading, we will focus on the main tasks of the library, which is the main direction of this field. It's time to carry out large-scale positive work in our country to improve the spiritual maturity of our people, to create modern infrastructures that increase the possibilities of providing quality services in the library and information sector, and to develop state programs. Taking into account our long future, our state is also spending a lot of money on the spiritual and educational sphere.

The innovative ideas that have been used and implemented in the information-library activities in New Uzbekistan are giving good results. However, due to the rapid development of technology in the world market, the current innovation cannot retain its novelty to a certain extent the next day.
